THE ODIN PROJECT

Foundations Course

A practical introduction to web development, HTML, CSS, Flexbox, and JavaScript.

PRESENTED BY ABINRAJ CHOVULLAKANDY

HTML · CSS · FLEXBOX · JAVASCRIPT

Made with GAMMA

01 · GETTING STARTED

The course starts with tools and mindset

Hands-on lessons, practice activities, and projects for real, working websites.

01 Purpose

Introduces the essential tools and skills used to build real, working websites.

02 Learning mindset

Build a steady habit, ask clear questions, search for solutions, and learn with the Odin Project community.

03 Main areas

Web basics, Git, HTML, CSS, Flexbox, and JavaScript, leading to full-stack development.

Made with GAMMA

02 · PREREQUISITES & GIT

Prepare your computer and track your work with Git

Understand how the web works, install the tools, then record every change.

Prepare your computer

Learn how browsers, servers, and websites connect, then install a code editor, the command line, and Git.

Git basics

Git tracks project files. A repository holds the project, and each commit saves a snapshot with a clear message.

Why version control

Review earlier work, recover previous versions, and collaborate with other developers.

HTML gives every webpage its structure

HTML is the markup language that gives content its structure and meaning.

Build with elements

Use opening and closing tags, a standard boilerplate, headings, paragraphs, and lists.

Link and show

Connect pages with links, and display visual content with images.

Project: Recipes

Build a simple multi-page recipe website with a homepage, ingredients, instructions, and links between pages.

Made with GAMMA

04 · CSS

CSS controls how the page looks

CSS styles HTML content and decides how elements take up space.

Selectors and rules

Target elements and apply style declarations to them.

The cascade and box model

Learn how browser rules and specificity decide styles, plus content, padding, border, and margin.

Block and inline

Learn how elements take up space and flow on a page. Inspect and debug with browser developer tools.

Made with GAMMA

05 · FLEXBOX

Flexbox arranges items in rows and columns

Flex containers and flex items work together to build organized page layouts.

Flex containers

Flex containers and flex items arrange elements in rows or columns.

Grow, shrink, align

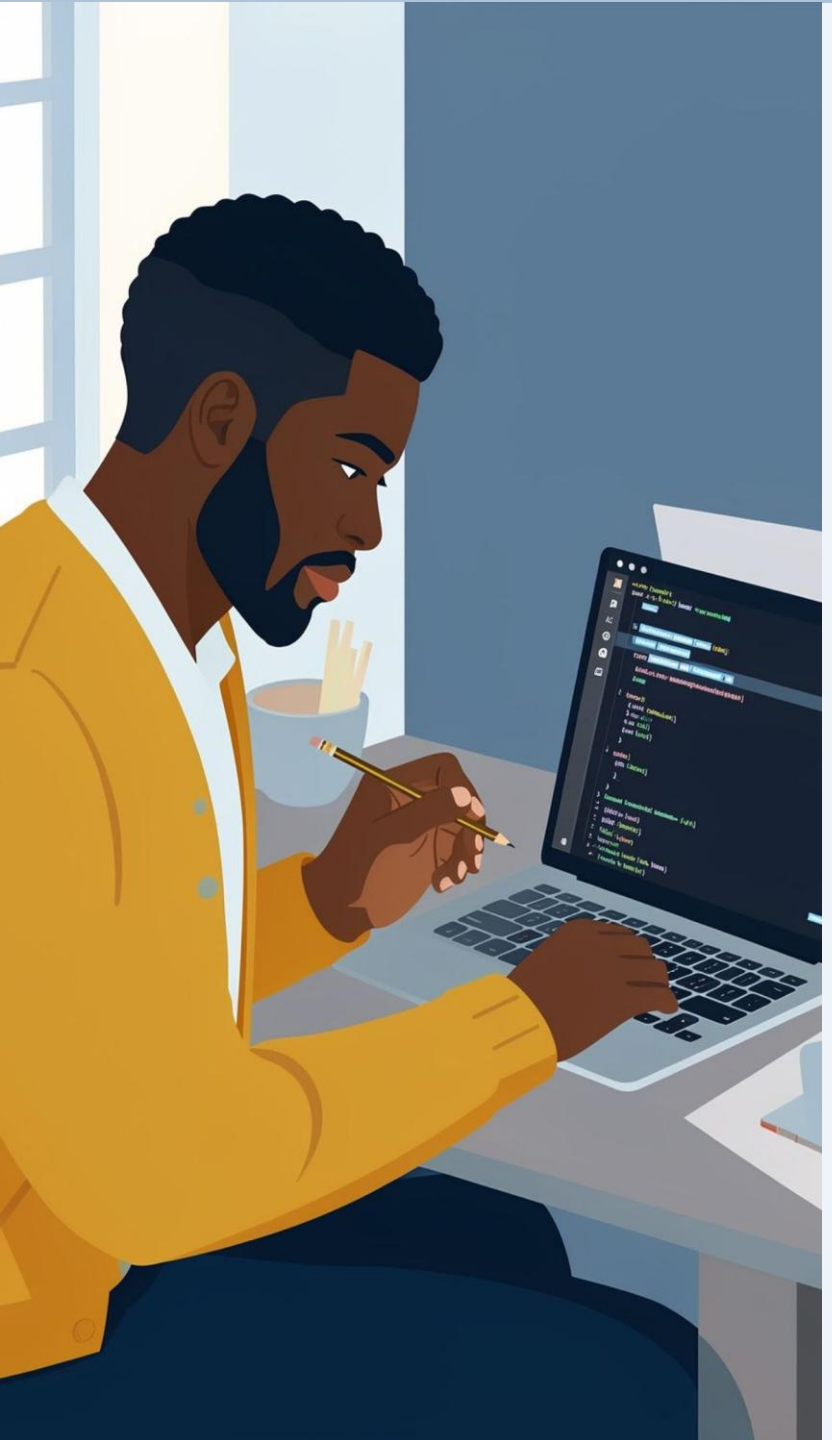

Handle space changes, then use the main and cross axes for alignment and spacing.

Landing page project

Combine HTML, CSS, and Flexbox in a complete page with sections, images, and buttons.

Made with GAMMA

06 · JAVASCRIPT BASICS

JavaScript stores data and makes decisions

JavaScript adds logic, interactivity, and decisions to websites.

01 Variables store information: let can change, const cannot be reassigned. Common types include strings, numbers, booleans, and objects.

02 Operators handle arithmetic and comparisons. Conditionals let a program choose: if a score is at least 50, show a pass message.

03 Developer tools (console, inspector, debugger) and Node.js help test, inspect, and debug code.

04 Solve problems by breaking them down, planning, coding, and testing.

Made with GAMMA

Arrays, loops, and objects organize information

Functions package reusable code. Break problems into steps, and read error messages carefully.

Arrays

Store multiple values in an ordered list. Indexes start at 0.

Loops

Repeat instructions with for and while loops, such as counting from 1 through 5.

Objects

Group related key-value pairs, such as a student’s name, age, and course.

Made with GAMMA

The DOM connects JavaScript to real user actions

Change the page

The DOM lets JavaScript select elements with querySelector and change their text, attributes, classes, and styles.

Listen for events

Respond to clicks, typing, and form submissions. Event listeners run a function when a chosen event happens.

Build projects

Rock Paper Scissors, Etch-a-Sketch, and Calculator combine core concepts into interactive applications.
